4 MISSIONS – 1 SOLUTION
STORMWATER IS OUR COMPETENCE

1 Transporting stormwater

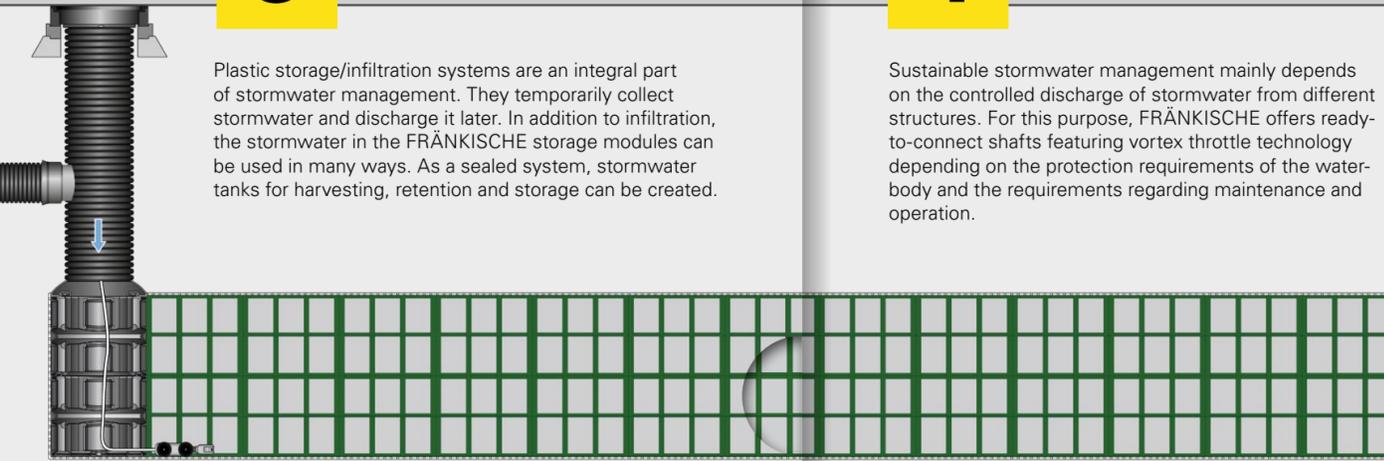

Where stormwater cannot be discharged naturally, it needs to be reliably collected and then discharged. The drainage systems by FRÄNKISCHE reliably and sustainably meet all the requirements in handling polluted surface water and infiltration water in road drainage.

2 Treating stormwater

Stormwater that is drained from impervious surfaces can cause problems for waterbodies or groundwater due to the amount of discharge or its contents. FRÄNKISCHE offers underground stormwater treatment systems that ensure a systematic elimination of pollutants.

3 Storing stormwater

Plastic storage/infiltration systems are an integral part of stormwater management. They temporarily collect stormwater and discharge it later. In addition to infiltration, the stormwater in the FRÄNKISCHE storage modules can be used in many ways. As a sealed system, stormwater tanks for harvesting, retention and storage can be created.

4 Discharging stormwater

Sustainable stormwater management mainly depends on the controlled discharge of stormwater from different structures. For this purpose, FRÄNKISCHE offers ready-to-connect shafts featuring vortex throttle technology depending on the protection requirements of the waterbody and the requirements regarding maintenance and operation.
